

IT Equipment Maintenance & Tracking System

**A dissertation submitted for the Degree of Master of
Information Technology**

**P. A. D. U. Athukorala
University of Colombo School of Computing
2018**

ABSTRACT

Ceylon Petroleum Storage Terminals Limited (CPSTL) is the common user facility company established to facilitate the petroleum storage & distribution activities in Sri Lanka. CPSTL serve around one thousand retail outlets island-wide owned by Ceylon Petroleum Corporation and Lanka Indian Oil Corporation PLC to meet the energy demand of the retail consumers in the country and the large number of bulk consumers in various industrial sectors involved in the economic development process. Two main installations supported by 11 bulk depots, which are involved in the storage and distribution network, with around 3000 employees actively participating in various activities of the company.

CPSTL use more than 500 personal computers, laptop, printers and scanners to smoothly run their process. Information Systems (IS) function is responsible for purchasing and maintaining IT equipment for CPSTL. IS function keeps all details (item location details, complain details, maintenance details, etc.) about IT equipment in physical files, Therefore they cannot give accurate reports about IT equipment using those physical files and takes more time to prepare it.

The key objective of designing and developing IT based system for IT equipment maintenance was to reduce the effort for report generation and increase accuracy of reports and also monitoring complaint and item status online. This system has been designed as a web based application. Therefore all functions of CPSTL could access through local area network and wide area network. This system uses PHP and MySQL database for implement functionalities and HTML5, JavaScript, jQuery, Ajax and Bootstrap framework for the frontend development. Morris chart and google chart use to develop MIS reports.

This system has gone through the testing phase including user acceptance testing. These testing part used positive and negative test scenarios for ensure functionalities of the system working correctly. The user evaluation helps to ensure that proposed system met the all requirements and objectives of the client.

ACKNOWLEDGEMENTS

I take this opportunity to express my gratitude and deep regards to my supervisor Dr. Lakshman Jayaratne, University of Colombo School of Computing for his guidance and monitoring through the completion of the dissertation and also the staff members of the University of Colombo School of Computing.

I may also thanks to Mr. Janak Dharmaprema manager of IS function and Mrs. Sakunthala Ekanayake deputy manager of IS function to give me the opportunity to develop this project and provide their valuable information to their respective fields. Finally I am grateful for my wife, my parents, family members and friends for their constant encouragement without which this assignment would not have been possible.

CHAPTER 1 INTRODUCTION

1.1. Background

Ceylon Petroleum Storage Terminals Limited (CPSTL) is a company engaged in bulk petroleum storage and distribution activities with state of the art infrastructure facilities for management of downstream product handling in Sri Lanka. They serve around one thousand retail outlets island wide owned by Ceylon Petroleum Corporation and Lanka Indian Oil Corporation to meet the energy demand of the retail consumers in the country and the large number of bulk consumers in various industrial sectors involved in the economic development process. They have two main installations which supported by 12 bulk depots, which are involved in the storage and distribution network, with around 3000 employees actively participating in various activities of the company.

CPSTL “Information Systems” function (IS) is responsible for purchasing, repairing and maintaining of IT equipment, which use in all functions and depots.

1.2. Motivation

The inspiration to develop a web based system for IT equipment inventory and work order management for CPSTL is to increase the efficiency, effectiveness and productivity of the whole process. Existing manual process had noticeable critical issues and system users were facing many difficulties in such working environment. Also lot of fraudulent activities taking place and accuracy of the output of manual system was lower than expected level. In addition to that the top level management also not satisfied with the existing outcome.

It is also noted that in several instances, IT equipment’s users were dissatisfied about service given by IS function due to the prevailing manual system. This will be affected to the productivity of the CPSTL. By considering all the stated above, it was decided to build a web based system to provide efficient service.

1.3. Problem domain

CPSTL IS function is responsible for all purchasing and maintenance of IT equipment’s. When purchasing IT equipment, they raise purchase requisition for purchasing request coming from all functions of CPSTL. They accept purchasing request by using requester clarifications. After purchasing, supplier hand over all IT equipment to IS function. Then IS

function log received items details in a log book and send those items to requested user function using manual equipment transfer note.

CPSTL IS function has separate team to handle IT equipment faults. Most of complains are coming through telephone. If they cannot solve the problem through telephone line, they have to visit the location and solve the problem. Otherwise they request to send item to IS function. They log those complains in log book.

Due to that manual process, they are facing many problems. Some of major problems are,

- i. Some important details are not recorded. Such that warranty details, equipment model, purchasing date, etc.. due to that reason they facing difficulties to claim warranty.
- ii. Due that manual process, current location of item cannot trace and also cannot find which IT equipment are in exact location or function. Therefor they cannot do physical inventory.
- iii. Computer configuration details are not recorded. Therefor internal parts of IT equipment can be steal or replace with broken parts.
- iv. Due to difficulty of finding repair history of particular equipment, some management decisions cannot taken. For example they want to ban purchasing of one brand due to high maintenance cost. They cannot do that because they haven't evidence.
- v. There are no records maintained for installed software details, IP address used, Operating system details of particular computer. Therefor computer technicians are facing problems when formatting computer. They don't know which software to installed.
- vi. CPSTL sign agreement for IT equipment maintenance with outside vendor. They do major repairs, broken parts replacements in computers and printers. If they cannot repair or need more time to repair, they give replacement for that item. Computer clerk record those details in log books. Due to that record keeping process computer clerk cannot give accurate report for items which already in vendor.
- vii. Take more time to prepare reports.

Due to above problems, they need a computer system to improve their efficiency and productivity. Further it helps to managers to take decision quickly and accurately using MIS reports generated by system.

1.4. Goals and Objectives

IT Equipment maintenance & Tracking system is proposed to maintain all details of IT equipment in web based environment by providing user friendly environment for users to facilitate the process in an efficient manner. Reduce manual documents and provide facility to view equipment history, location, configuration details, status and so many summery reports. Below points are mentioned as goals and objectives of implementing the IT Equipment maintenance & Tracking system for CPSTL.

- Developed fully functioned web based IT Equipment maintenance & Tracking system.
- Maintain 100% accurate IT equipment inventory.
- Maintain 100% accurate repair history for all IT equipment.
- Reduce time taken to generate reports and increase accuracy of the reports.
- Utilize work load by monitoring activities of computer technicians.
- Reduce unnecessary work load to the employees.

1.5. Project Scope

IT Equipment maintenance & Tracking system is proposed to implement in Web Based environment using PHP proگرامing language and MySQL database with below functionalities.

- Maintaining User Authorization
- Maintaining Parts Category master
- Maintaining Parts features / characteristics master
- Maintaining IT equipment parts master
- Maintaining IT equipment category master
- Maintaining IT equipment master
- Maintaining Software master
- Maintaining Location/function master
- Mapping parts, software, location and maintaining IP address to IT equipment
- Maintaining & printing IT equipment maintenance request
- Maintaining IT equipment maintenance details
- Maintaining equipment transfers

- Maintaining equipment included in service & maintenance agreement.
- Generate MIS reports (IT Equipment maintenance history report, IT Equipment Ageing report, Location wise IT equipment details, IT equipment Transfer Details report, IT equipment (PC & Laptops) software, IP address and other details, etc.)

1.6. Structure of the thesis

Chapter 1 – Introduction

This provides the overview of the project in a way that motivates the reader while defining the problem clearly and briefly with the objectives and scope of the project.

Chapter 2 – Background

Background study carried out to compare with available similar systems, specifications and variations of the system.

Chapter 3 – Analysis and Design

Requirement Gathering, Analyzing and Designing techniques are discussed. Functional and non-functional requirements of the system will also be included.

Chapter 4 - Implementaion

This chapter include the aspects such as selection of implementation technology (languages, platforms frameworks, platforms etc.) and the justification for the choices.

Chapter 5: Evaluation and Testing

This is an important chapter of the dissertation which presents the user evaluation and testing of the application.

Chapter 6: Conclusion and Future Work

This chapter summarizes the work, discusses its findings and contributions, points out limitations of the current work, and also outlines directions for future research.

CHAPTER 2 BACKGROUND

2.1. Business Process

➤ IT Equipment Purchasing process

All new IT equipment requirements of any function is requested from IS function through a letter signed by relevant head of function. That letter contains Item Description and Internal Order (IO) numbers which want to create purchase requisition (PR). Then considering the request letter, IS function employee creates PR and sends it to procurement function. After the procurement process, supplier delivers the items to IS function. Then IS function technician checks those new items and accept receipt if there is no issue. If new item is laptop or desktop computer, then technician installs user requested software, printer drivers and assign IP address to the PC. After that he marks asset numbers and transfers to relevant function using equipment transfer (ET) form.

➤ PC, Printer and Scanner repairing Process

When IT equipment is broken, user calls to IS function and tries to solve over the phone. If it is unable to solve the problem, then computer clerk logs the issue in CR book and raise a “Repair & maintenance” form.

Figure 2-3 Equipment Transfer Form

If user needs replacement and resources are available in IS function, then technician send the replacement for broken equipment to user using equipment transfer form. If broken equipment (Desktop computer, Laptop) has software or operating system problem, computer technician fixes the issue. If it is hardware failure and it has warranty, then inform the issue of item to supplier through email. If there is no warranty, then inform it to annual service & maintenance agreement partner. Then they come and correct the issue. If they cannot correct the issue, they carry equipment and send back similar equipment or same equipment by fixing the issue. To send equipment outside, needs to get gate pass document.

2.2. Review and Alternatives

There are several systems found in Internet which related to my proposed system.

Eg. Fixd Software [1], Manwinwin software [2]

The above systems have following features.

- Management of equipment / Asset pools
- Maintenance Management
- Inventory management
- Analysis, reports and maintenance indicators

2.2.1. About Fixd Software

Fixd is web based asset and work order management software. Fixd mainly focused on work, asset, inventory, people and knowledge. Task and schedule maintenance are included in “work”. User creation is included in People. Reports are included in knowledge.

In Fixd software system we can create materials and assets. Also Fixd software support to create asset using material. That means material is component of the asset. But we can add only one component to the asset.

Following figure (figure 2.4) shows material creation in fixd software

The screenshot shows the 'Add Material' form in the Fixd software. The form is titled 'Add Material' and has a sub-header 'Material'. The form contains the following fields and options:

- Title**: A text input field.
- Type**: A text input field with a tooltip: "The classification of the material. eg. consumable, safety equipment, electrical, mechanical, etc."
- Unit of Measurement**: A text input field with a tooltip: "The unit by which both consumption and ordering is measured. eg. kilogram, pound, unit, bag, tube, etc."
- Major Component**: A checkbox labeled "Track this Material as a Major Component" with a tooltip: "This material will be used to create assets in the asset hierarchy."
- Unit Price**: A text input field with the value "0".
- Manufacturer**: A text input field.
- Model**: A text input field.
- Internal Reference**: A text input field.
- Description**: A large text area for entering a detailed description.

At the bottom of the form, there are two buttons: "Save" and "Cancel".

Figure 2-4 Material creation in fixd software

Following figure (figure 2.5) shows asset creation in fixd software

Add Asset

Asset Details

Name
Choose a name that will allow you to identify this specific asset from a list of all your assets.
eg. Vehicle TVG-456, Room 112, Apartment 186, etc.

*** Site**
The site where the physical asset is currently located.
eg. Holiday Inn - Escondido, Windy Willows Wind Farm, One Miami Condominium, etc.

*** Major Component**
What generic major component is this asset?
eg. Toyota Hilux, Caterpillar F20, Hotel Room, etc.
[Copy Asset](#)

Event List « select »
Only select if you have already established an Event List.
eg. SCADA alarm codes, fault codes, etc.

Serial number

Unit Price

Servicing Details

Asset Start Date
Date when this asset first went into use.
 This is also the **Maintenance Start Date**

Figure 2-5 Asset creation in fixd software

According to above figures (figure 2-4 and figure 2-5) there are unwanted input fields and some important fields which need by CPSTL are not there. For example screen size of monitor, capacity of RAM. Therefore those material and asset creation need new development to achieve CPSTL requirement.

Using Fixd software we can create task as shown in following figure. After that we can assign several technicians for this task and allocate time period to do that task. Then we can add labour hours and materials which want to complete this task.

Add Task
on PC-ISDarshana - pc5677h7774, Kolonnawa - IS Function

Task

Task Information

* **Title**

* **Work Type** Internal Repair

Priority Medium

Figure 2-6 Add Task in fixd software

We can generate asset history report (figure 2-7) using fixd software as follows. This report shows all asset transfer details and its' repair history.

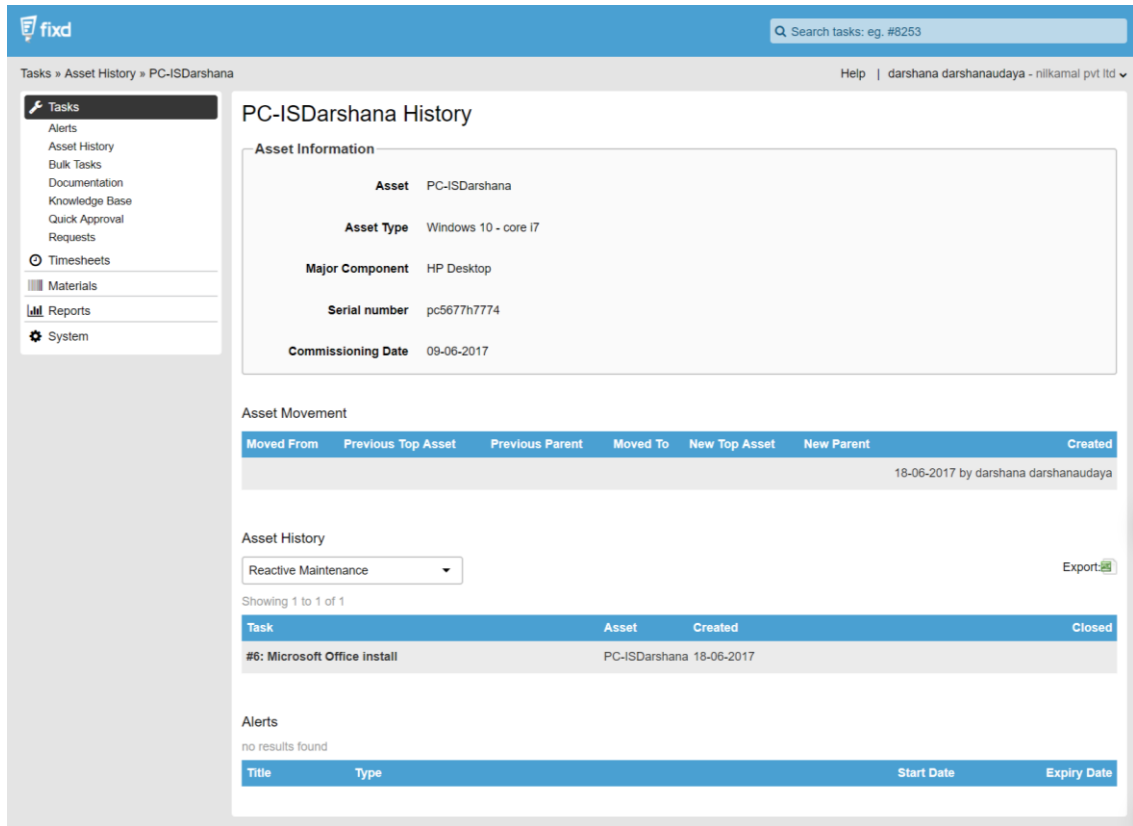

Figure 2-7 Asset History report in fixd software

And also we can generate task status using fixd software as follows (figure 2-8), this task status reports shows all activities involve to do particular task.

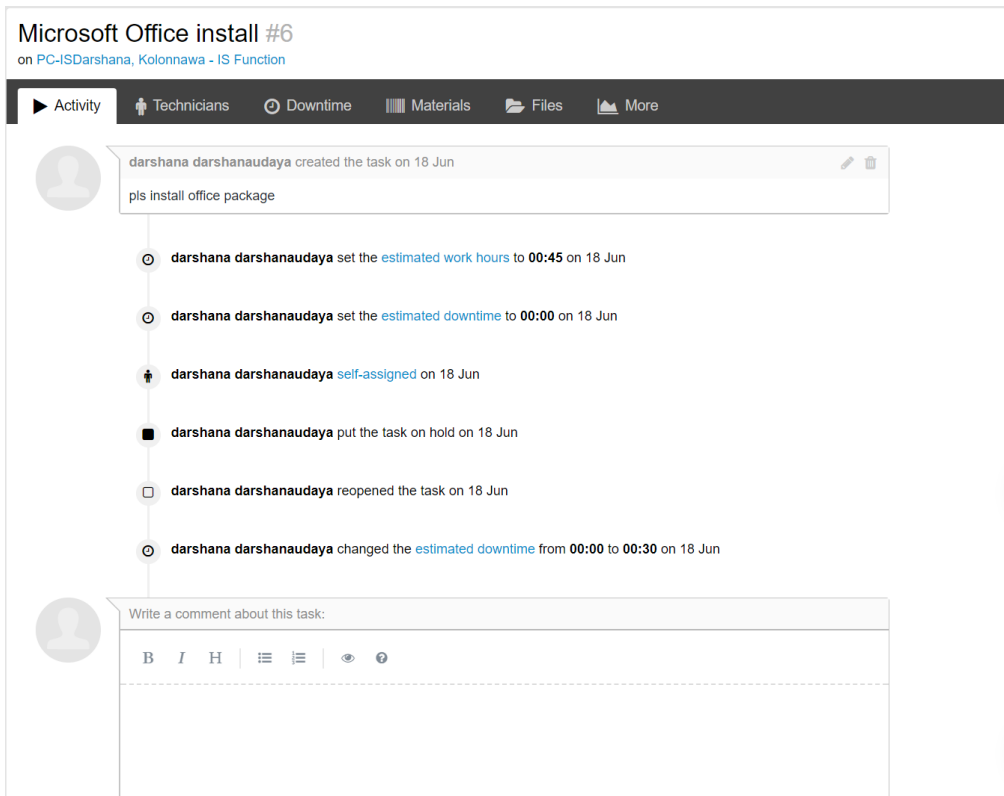

Figure 2-8 Task Status in fixd software

Technician details of above task as follows.

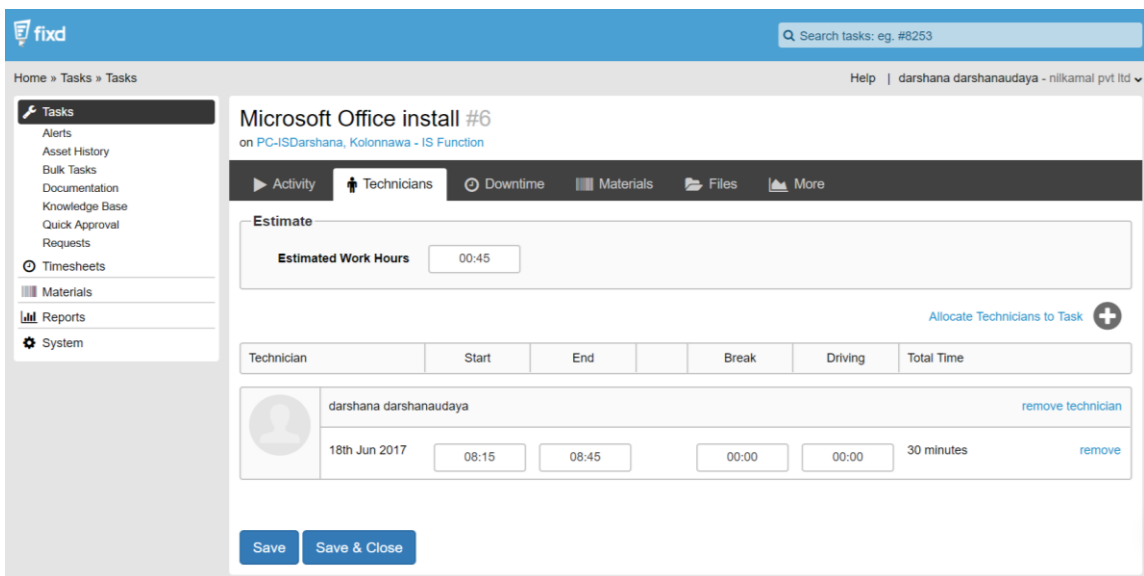

Figure 2-9 Technician Details in fixd software

The above facilities are available in fixd software and it cost \$29 per month as a licence fee. However, fixd software system did not full fill the CPSTL requirements. It is not providing facility to maintain computer software details, annual agreements details, complain

and Computer configuration details etc. Therefore, CPSTL needs their own system to full fill their requirements.

2.2.2. About ManWinWin Software

Navaltik Management owns ManWinWin Software maintenance management solutions , currently in its 5th generation. There are 2 categories of this software, ManWinWin Express and ManWinWin web.

ManWinWin Express is installed in the users PCs or in an application server and the database is installed in an SQL Server. This solution is suitable for operation in a local network with several users working in the same database, sharing real time information. There are two option to purchase this software, an annual license (Use-IT) or lifetime license (Keep-IT).

ManWinWin Web, SaaS (Software as a Service) Solution is an integrated service for providing software applications to end users without requiring the end user (client) to install and run the application on their own computer or network. ManWinWin web is hosted remotely in powerful servers and accessed safely by the end user through an internet connection. Because the software is hosted remotely, users have no costs with additional hardware and no trouble with installations, maintenance or updates. There are two options SAAS corporate and SAAS professional for licensing ManWinWin web. ManWinWin software has following features.

- Dashboard
- Equipment list
- Maintenance requests
- Maintenance work orders
- Work order records
- Work order reporting
- Materials / Spare parts list
- Materials / stock outs
- Man-hours records
- Third-party services records

ManWinWin software has not covered some major functionalities of required system. Such as software details, agreement details and item configuration details. Therefore this system is need more changes to fulfil the CPSTL requirement and CPSTL have to pay for it.

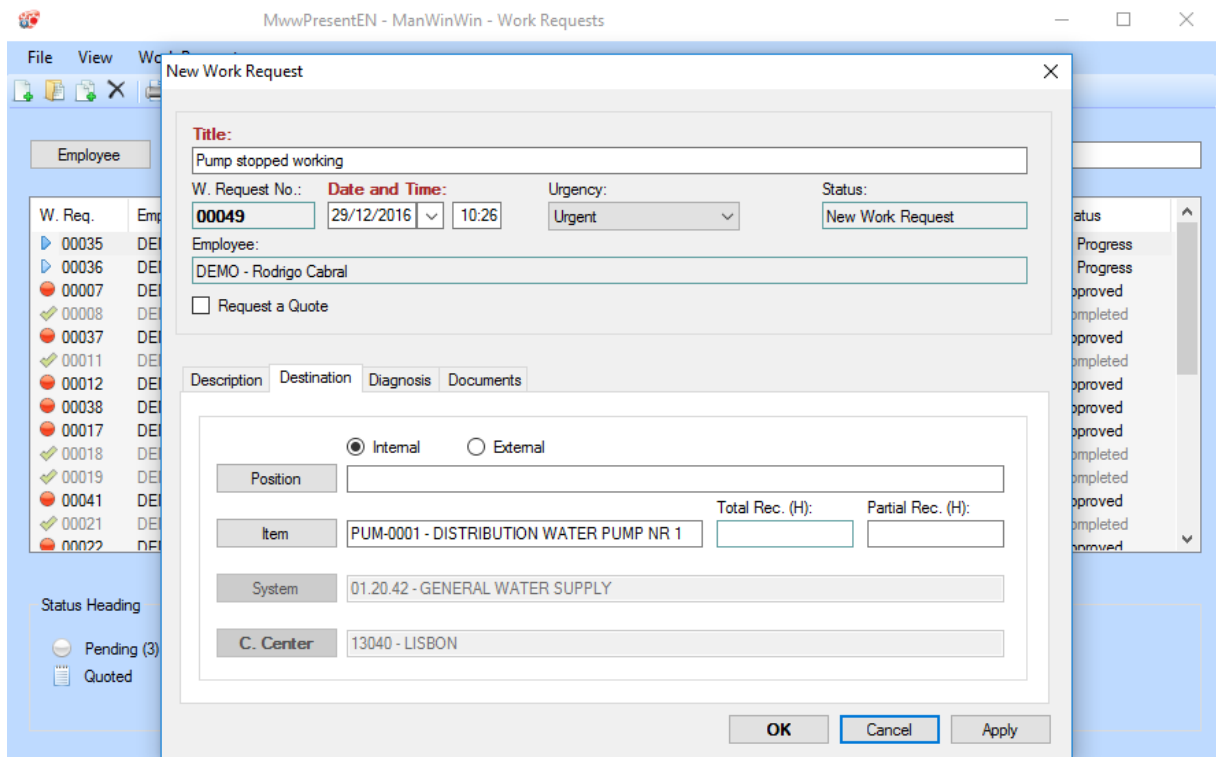

Figure 2-10 Work Request of ManWinWin software

CHAPTER 3 ANALYSIS AND DESIGN

Analysis has to do a major role in software development life cycle. Before converting a manually driven process in to a computerized system it is very important to get a vivid idea about problem domain and the user requirements.

3.1. Requirement Gathering and Analysis

Understanding fully what a project will deliver is critical to its success. So it was little bit difficult to get rid from the ambiguity of the requirements. Had to allocate a considerable time for this phase and needs to be done it in a structured manner.

Followed the below set of standard techniques to gather requirements.

Observation.

The analyst can either participate or can watch how the work is carried out inside the company. This was very important because it help to allocate weights and priorities to various kinds of daily functionalities.

Inspection of existing documentation.

Studied the existing Repair & Maintenance reports, complain log book and Outside repair log book which help to provide information on developing the new system.

One-on-one interviews

Collect information from the computer clerk, computer technician, System Engineer and Information Systems Manager through face-to-face interaction. Carried out unstructured interviews and structured interviews according to the situation.

Structured Interviews - Pre-defined specific set of questions are there to ask from the interviewee.

Unstructured Interviews - Only a general goal or subject in mind. Questions may vary from one individual to the other.

3.1.1. Functional Requirement

1. User Management module

- a) User Creation – System administrator can create users and set initial password for log into system.
- b) Grant Authorization – System administrator can grant authorization for users according their role in the system.
- c) Change password – giving facility to users for change their passwords.

2. System configuration module

- a) Item Category maintain
- b) Item features / Characteristics maintain
- c) Parts Category maintain
- d) Parts features / Characteristics maintain
- e) Mapping Item Category & Parts Category
- f) Location maintain

3. Item Management module

- a) Item Creation – this will facilitate to create items
- b) Change Item – using this any item changes can be done
- c) View Item – any user can view item using serial number or asset number
- d) Issue Item – this will help to issue items.
- e) Item transfer – used to transfer item between two locations

4. Complain management module

- a) Raise Complain – users can complain about any issue in IT equipment
- b) View complain – user can view complain details and status details about complain

5. Work order management module

- a) System Engineer or computer clerk assign technician for complain to investigate the issue in item.
- b) After correcting the issue in item, computer clerk or technician enter job details into the system and close the complaint. (time taken to correct the issue, issue details)
- c) If issue is not in an item and technician cannot solve, then technician can assign other person to look that issue. Eg. Network issues handle by network engineers.

6. IT equipment service & maintenance agreement management module

- a) Maintaining annual service and maintenance agreement with serial numbers of items included to the agreement.
- b) Remind renewal dates of annual service and maintenance agreement.

7. Report generation module

- a) Item maintenance History Report
- b) Location wise item details report
- c) Item aging report
- d) Technician wise Performance evaluation report

3.1.2. Non-Functional Requirements

- **Effectiveness** - System should directly affect with the current procedures of the IT equipment maintenance section of Information Systems function.
- **Performance** – The system should not take long time to save items and work orders. Website should load very quickly, else the users get annoyed.
- **Reliability** – Information which contains in the system should be accurate. Usually measured as a percentage.
- **User Friendliness** – Interacting with the system should be easy for the users and interfaces of system should not confused any user.
- **Availability** – Web site should be available whenever the customer need.
- **Quality** – System should maintain the quality of the services at all the phases.

3.2. System Design

3.2.1. Usecase Diagram for proposed system

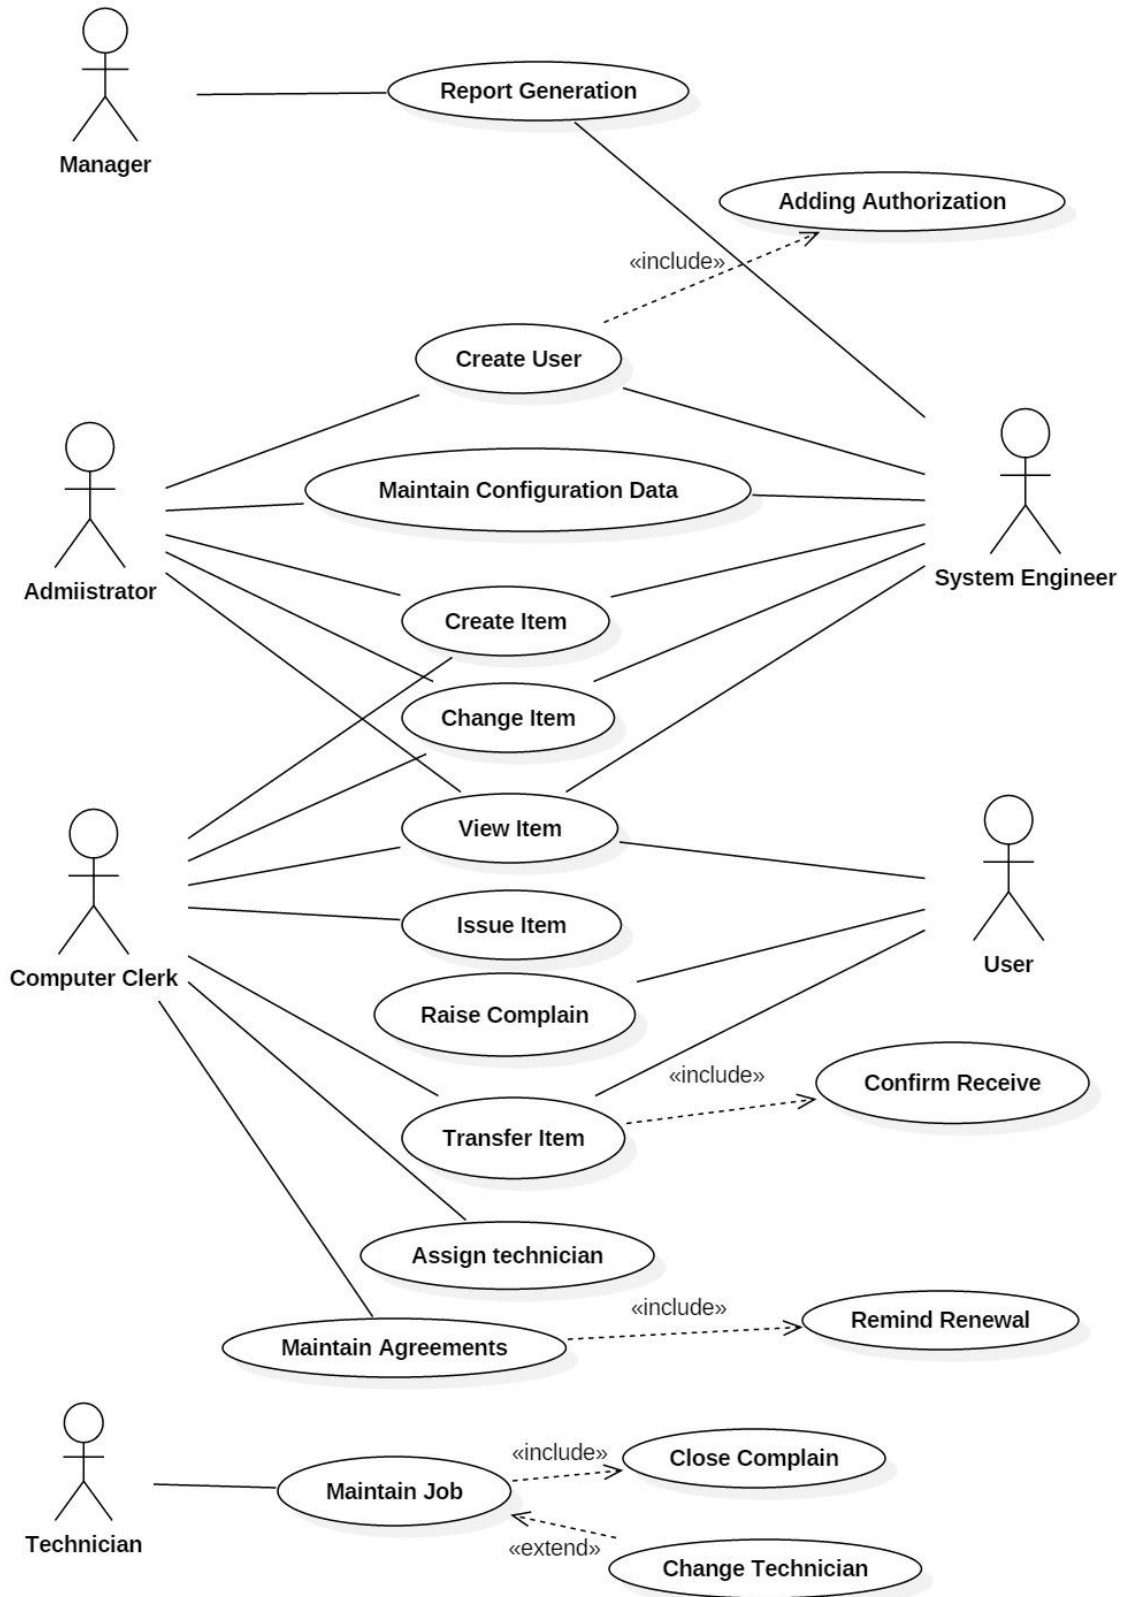

Figure 3-1 Usecase Diagram

3.2.2. Class diagram for proposed system

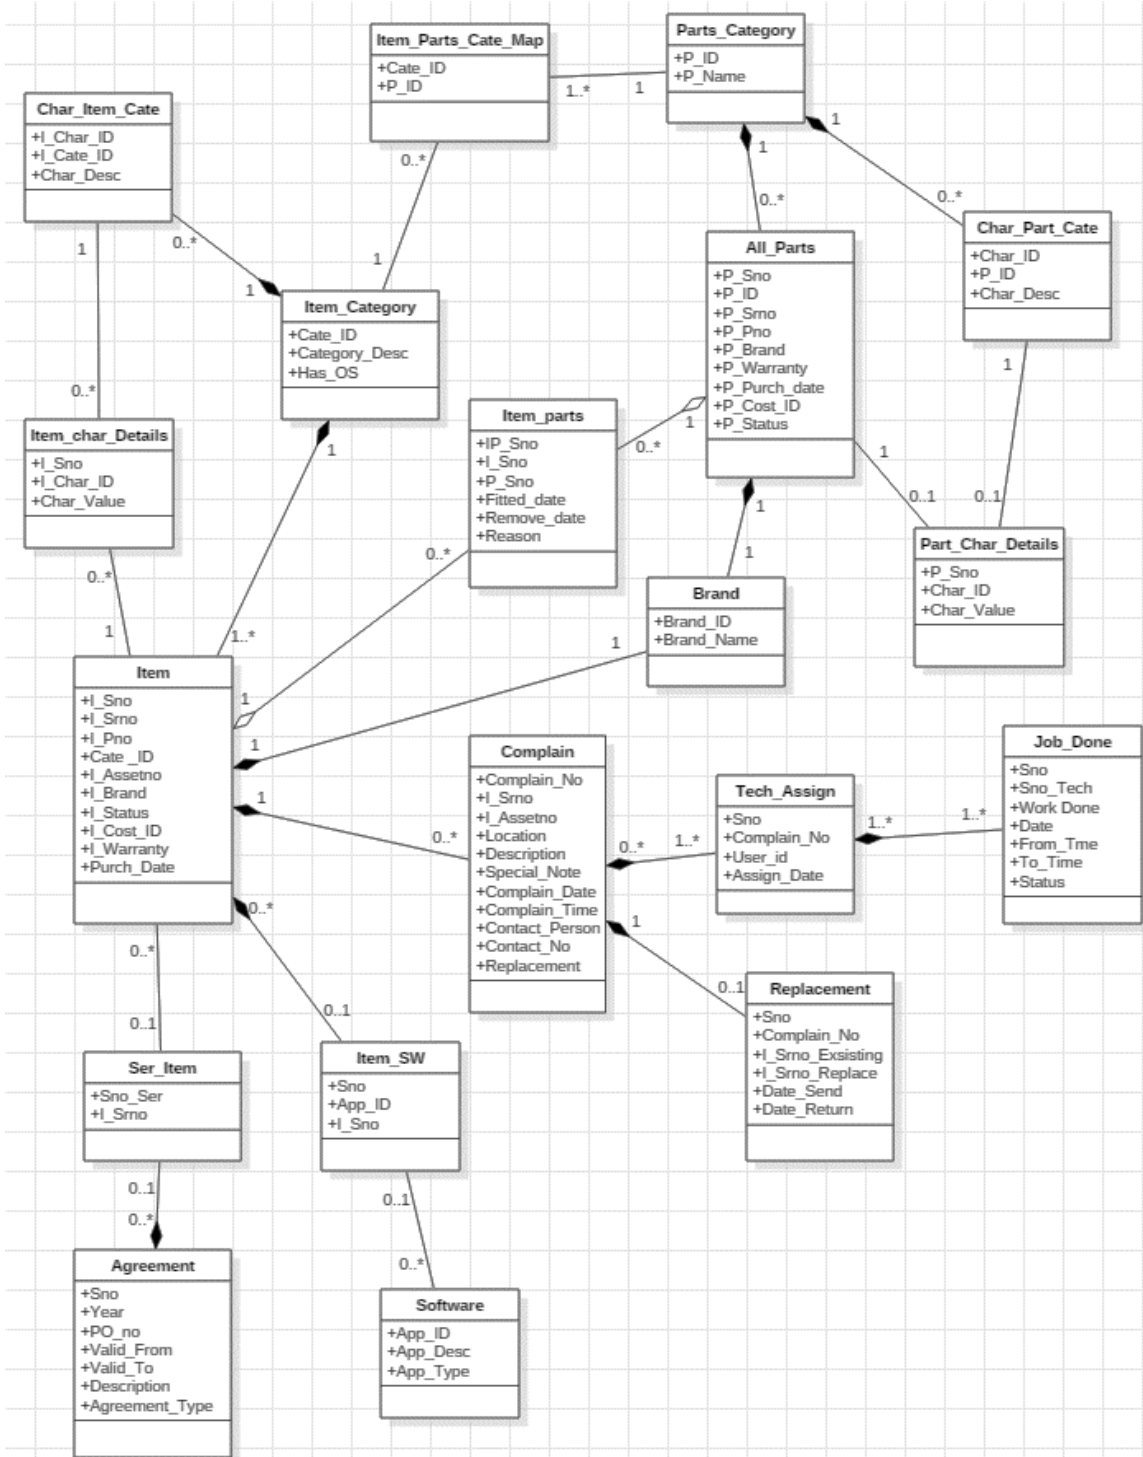

Figure 3-2 Class Diagram For Proposed System

3.2.3. Sequence Diagram for Technician Assign to Complain

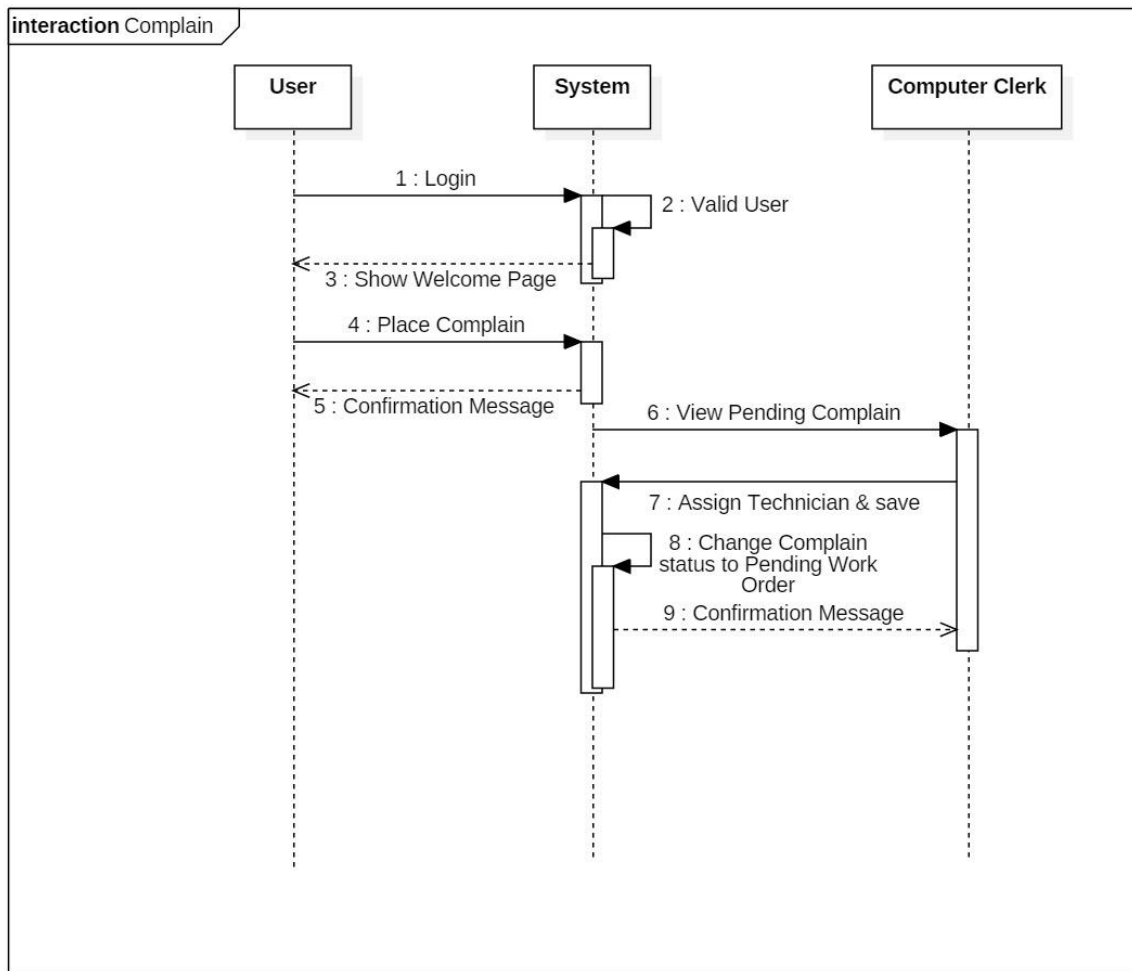

Figure 3-3 Sequence Diagram for Technician Assign to Complain

3.2.4. Activity Diagram for Technician Assign to Complain

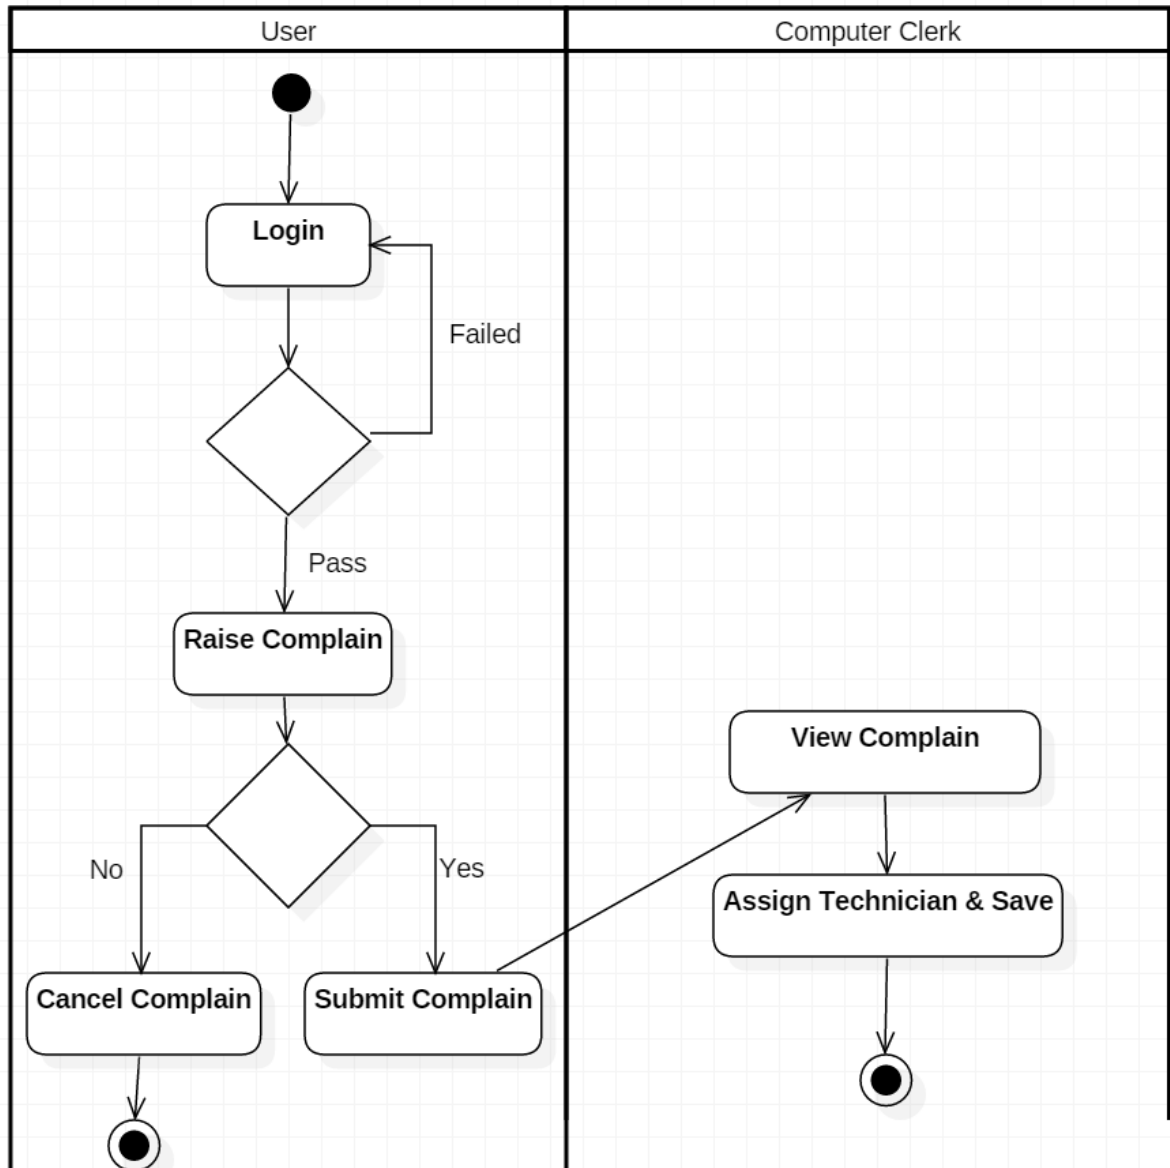

Figure 3-4 Activity Diagram for Assign Technician to Complain

CHAPTER 4 Implementation

4.1. Implementation methodology

This chapter describes the process and phases of implementation of the system. Selection of an implementation technology depended on set of key considerations

- Cost of the software and software licensing fee
- Initial and maintaining cost for the hardware tools
- Accessibility
- IT literacy of the end user
- Ambiguity of set of requirements.

Incremental implementation method had to select as the execution procedure due to above considerations. A prototype is developed as the initial state and modules and functionalities are added gradually to the same prototype model.

4.2. Hardware and Software implementation of the system

Hardware Requirements-

CPSTL has already maintained server as web server for their intranet and also they have good network between depots and kolonnawa terminal. So there is no any cost for hardware requirements.

For Web Server & set up Network

- ❖ Intel Core i3 Processor
- ❖ 4 GB RAM (minimum)
- ❖ 80 GB Hard disk (minimum)
- ❖ Keyboard / mouse / monitor 15"
- ❖ Hub / Switch / Router
- ❖ Network Card
- ❖ Network Cables & Connectors
- ❖ UPS (uninterrupted power supply)

For Client computers

- ❖ Intel Pentium IV with 500MHz speed
- ❖ 512 MB RAM (minimum)
- ❖ 40GB Hard disk (minimum)
- ❖ Keyboard / mouse / monitor 15"
- ❖ Network Card
- ❖ UPS (uninterrupted power supply)

Software Requirements

- ❖ Microsoft Windows Xp or above.
- ❖ WAMP Server 2.0 or above
- ❖ Internet explorer or relevant browser.

Development tools used

- ❖ WAMP Server
- ❖ Adobe photoshop cs4
- ❖ Sublime Text used as PHP editor

Technologies used.

- ❖ Apache – Used as a web server software
- ❖ PHP – Used to do modifications to web pages
- ❖ HTML - Used to do modifications to web pages
- ❖ CSS / Bootstrap – Used to develop colorful & interactive web pages
- ❖ JavaScript / Ajax – Used for form validation and design interactive web pages
- ❖ MySQL – to develop the database

4.3. Design Pattern

Module design pattern is used to developed “IT Equipment Maintenance & Tracking System”. In software engineering, the module pattern is a design pattern used to implement the concept of software modules, defined by modular programming.

Using this concept, web page is divided into 5 modules. They are “header”, “topbar”, “sidebar”, “body” and “footer”. “header”, “topbar”, “sidebar” and “footer” modules are common for all web pages. “Body” module is changed according to function of each pages.

4.4. Appearance of major functionalities

Below are the major user interfaces which were designed according to the user requirements.

4.4.1. Welcome Page

After successful login, welcome page is appear. It has top bar, side bar, body and footer. Top bar contains company logo, company name, User Name and Alerts. Side bar contains System name, item search box and menu items. This menu items permission is restricted according to user role. Administrator welcome login is given below. He has all th authorization of the system.

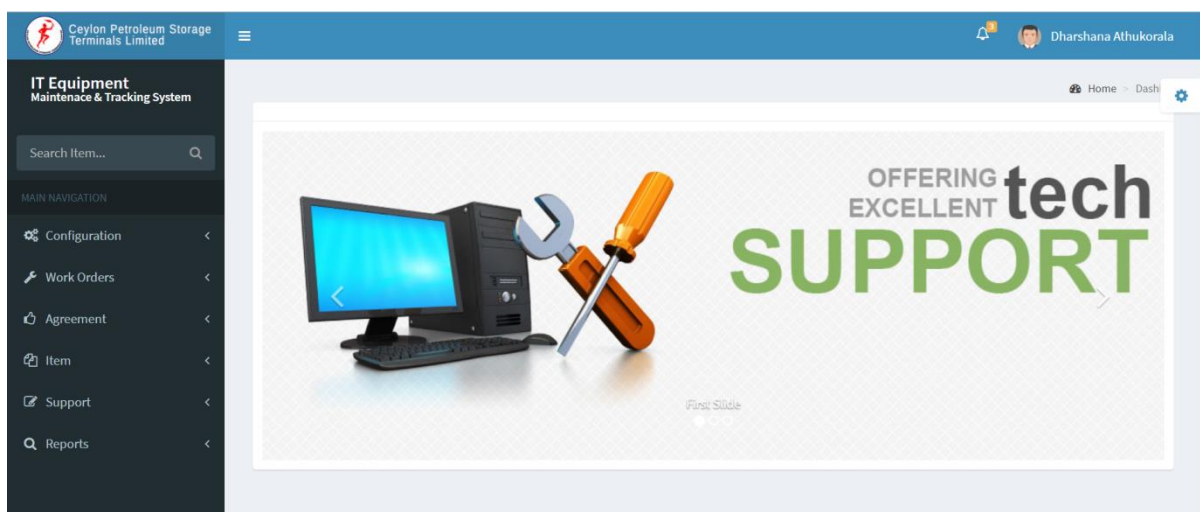

Figure 4-1 Welcome Page

4.4.2. Item Creation

In this system, item is the most important object because of the following reasons.

- Item has its' own characteristics. Such as Desktop computer has computer name, IP Address, Model name, no of USB ports etc..
- Item has several parts (figure 4-2). For example desktop computer has RAM, VGA, Hard disk, Mother board, power supply unit but Printer has printer head, cartridge etc..

Figure 4-2 Structure of system Unit

- Item Parts also has so many characteristics. RAM has characteristics like Size, Type.

According to above requirement, IT Equipment maintenance & Tracking system was designed to handle any item with that complexity.

In this system user has to select item category first because required details are changed according to item category. All the item categories has common details such as, serial no, product no, asset no, item manufacture, purchase date, warranty period, item location and item condition. This details are shown after selecting item category and also parts name are displayed to select.

Select a Item Category

Desktop PC

Item Serial No

Item Product No

Item Asset No

Item Manufacture

Figure 4-4 Item Parts form

Here collapsible group is used to get parts details. That parts are vary according to user selection and item category. Also input fields are changed according to parts. So it is very difficult to get save details of item parts. Following code is used to generate parts form.

```

<?php
require('config.php');

$Cate_ID = $_POST["Cate_ID"];
$queryy = "SELECT P_ID, P_Name FROM v_item_part where Cate_ID = " . $Cate_ID;
$result1 = mysqli_query($con, $queryy);

if(mysqli_num_rows($result1)>0) {
    while($row1 = mysqli_fetch_assoc($result1)) {
        $ChkName = "chk" . $row1["P_ID"];
        // To get user tick parts
        if(isset($_POST[$ChkName]) && $_POST[$ChkName] = 'on'){

            $_SESSION["P_ID"] = $row1["P_ID"];

            <div class="panel box box-primary">
            <div class="box-header with-border">
            <h4 class="box-title">
            <!-- Creating collapse group for part-->
            <a data-toggle="collapse" data-parent="#accordion" href="#collapse" . $row1["P_ID"
            ].""; ?> >
            <!-- Display collapse group part name-->
            <?php echo $row1["P_Name"]; ?>
            </a>
            </h4>
            </div>

            <div id=<?php echo "'collapse" . $row1["P_ID"].""; ?> class="panel-collapse collapse">
            <div class="box-body">
            <!-- Display input box to get Parts details -->
            <?php require('addPartsInItem.php'); ?>
            </div>
            </div>
            </div>
        }
    }
}
    
```

Figure 4-5 Cording for Item Parts form

Following code in “addPartsInItem.php” generate label and textbox to enter characteristics of parts you added in parts configuration

```

<?php
// getting characteristics of the part
$queryz = "SELECT Char_ID, Char_Desc FROM char_part where P_ID = " . $_SESSION["P_ID"];
$result = mysqli_query($con, $queryz);

if(mysqli_num_rows($result)>0) {
    $i = -1;
    //design interface with two columns
    while($row = mysqli_fetch_assoc($result)) {
        $i += 1;
        if($i%2==0 && $i!=0){
            ?>
            </div><br/>
            <div Class = "row">
            <?php
            }
        ?>

        <!-- Display label and text box for characteristic -->
        <div class="col-sm-6">
            <label for="<?php echo "Var" . $row["Char_ID"]; ?>"><?php echo $row["Char_Desc"]; ?></label>
            <input type='text' size='50' maxlength='50' class="form-control" name='<?php echo "Var" . $row["Char_ID"]; ?>' autocomplete="off" value="" id="<?php echo "Var" . $i; ?>" placeholder="<?php echo $row["Char_Desc"]; ?>" />
        </div>
    }
}
}
?>

```

Figure 4-6 Code for generate interface for parts characteristics

After saving parts form next screen request item characteristics / features details and operating system details if item has.

Figure 4-7 Form of Item features

Maintain Work Order

Following Screen is related to initial screen of work order maintain page. This page contains forms to maintain work done, adding parts, removing parts, view work done and maintain item software details.

The screenshot displays the 'Work Order maintain' page. On the left is a sidebar with a blue header 'Item History' and a 'Job Details' section containing the following menu items: 'Add Item Serial No', 'Add Work Done', 'View Work Done', 'Adding Parts', 'Removing Parts', and 'Install Software'. The main content area features a top navigation bar with 'Home > Dash' and a settings gear icon. Below this, the form is organized into several sections: 'Complain No' (201801121020101), 'Serial No' (SGH85007KB), and 'Asset No' (580000000822); 'Item Location' (ENGINEERING - DEVE.), 'Contact Person' (MRS GEETHA), and 'Contact No / Extention No' (517); and a 'Complain Details' section with a text area containing 'Printer error'.

Complain No	Serial No	Asset No
201801121020101	SGH85007KB	580000000822

Item Location	Contact Person	Contact No / Extention No

CHAPTER 5 EVALUATION AND TESTING

Success of an every project is relay on the testing process. It aims at determining whether the promises about the product by the supplier and the needs of the customer are met on an acceptable level. This chapter describes the process of verifying and validating the system with a structured predefined manner.

5.1. Testing

Testing process includes verification and validation. Verification is done at all the stages of system development to check whether system is developed correctly. Validation is done after implementation on the executable system to check the system requirements given by the clients at the initial stages against the features of the final system.

5.1.1. Unit Testing

Unit Testing of software applications is done during the development (coding) of an application. The objective of Unit Testing is to isolate a section of code and verify its correctness. When I'm developing this system I have tested every functions and modules functionality immediately after coding done. It was help me to correcting issues before user testing. So it was minimize the major issues and helped to increase user satisfaction.

5.1.2. Integrated Testing

Integrated testing technique and acceptance testing will be used at the last phase. Modules are combined and tested as group in multiple ways. In this context, a unit is defined as the smallest testable part of the system. Integration testing can expose problems with the interfaces among program components before trouble occurs in real-world program execution.

5.1.3. User Acceptance Test

User acceptance testing will go in line with the implementation of the system. Manual process also go parallel with the preliminary implementation stage and system will be tested by the exact end user. Most of the time minor changes will capture at this stage. Testing process is almost done at the end of this stage.

5.2. Test Plan and Test Cases

In general a test plan consists with test cases, test schedules, test objectives and testing strategies. Among the above mentioned parts test cases play very crucial role in the process of evaluating the test plan. A test plan mainly contains the following components. Test Case ID, Functionality to be tested, testing procedure, test data, expected results and the priority should be given to a particular test case. All test data should be selected based on the specification for black box testing and all the individual system modules should be tested against number of test cases. Refer Appendix B for all test cases and its' result.

5.3. User Evaluation

In order to collect data for the evaluation process, sample has to identify. Sample was selected according to user level define in the system. This sample was included One Manager, two deputy managers, System Administrator, two technician, Computer clerk and three normal users. This evaluation form was given after the system training. Refer below table (Table 1) for the summery of user evaluation result.

No	Statement	Strongly Agree	Agree	Neutral	Disagree	Strongly disagree
1	This system fulfills the IT equipment maintenance and location tracking requirement.	4	6	0	0	0
2	Users can understand the system easily.	7	3	0	0	0
3	This system response quickly.	5	3	2	0	0
4	This system interfaces are very attractive.	8	2	0	0	0
5	Users can navigate through the system easily.	4	5	1	0	0
6	System error messages help to understand, what was the mistake.	5	4	1	0	0
7	This system reports help to make decisions quickly.	6	2	2	0	0
8	This system increases efficiency and productivity of IS function.	8	2	0	0	0

Table 1 – User Evaluation Results

According to evaluation results (refer Table 1), there is no negative feedback. That means they are happy with the new system.

Figure 5-1 User Evaluation results

According to that result they accept the “PC Maintenance & Tracking System” and they are happy about it. 80% of users are satisfied about reports generated from the system and the other 20% were neutral. Initially some PCs took more time to load the system due to some operating system configuration. That was the key that 20% of users were given neutral for system response time.

CHAPTER 6 CONCLUSION AND FUTURE WORK

The conclusion chapter here illustrates a total overview of the developed system with its constraints, achievements and draw backs. And this will summarize the author's reflection on the whole project work including a critical appraisal on the successes and limitations of project approach and the development of system itself.

6.1. Lesson Learned

IT equipment maintenance & tracking system project helped me to gain new knowledge about analyzing, designing, developing and implementing of software projects practically. A few set of problems were encountered at the developing stages and found suitable solutions to overcome them. Some of them are design level and also some of the requirements need to change slightly.

In the initial requirement gathering process they agreed to raised complain with item serial number or asset number. However after implementation they want to raise complain without serial number because it was difficult to find. So system was changed to accept complain without serial number and added facility to add serial number when maintaining work order.

In system design stage, it was very hard to design database for item because of its' complexity. Also interface design for item was very hard and it was taken more time to design it. Due to this is web application, it was taken more time to design interfaces. Sometimes some JavaScript files were not executed as preferred.

In Data migration process, there were problems to find details of items. Such that item purchase date, warranty information, asset numbers and part serial number. So it is affected to some reports generated from the system.

6.2. Critical Assessment of the project

The task in hand was to build a web based IT equipment maintenance and tracking system for CPSTL. The main objective of the system was to reduce their manual work and provide good service for all function of CPSTL. There are several work order management system on the web for purchase. But CPSTL requirement was not fulfill by those system. Those system design targeting common work order process. Therefor there are more unnecessary input fields and user interfaces are very complex. Also those system reports are not fulfill the CPSTL requirement. Therefore those system need more changes to do for fulfill CPSTL requirement. That is very expensive. Due to that reason, it was very cost effective if they can develop it in internally. Then IT equipment maintenance and tracking system was developed and all the requirements in the user specification were fulfill at the end of the project. The user evaluation test results showed that the users were satisfied with how the system functioned. This was the main achievement of the project.

6.3. Future Enhancement

Currently “IT Equipment maintenance & Tracking System” hasn’t any alert informing system. Like SMS or Email. Because every employee of CPSTL haven’t email id and very limited person has email id and internet connection. So SMS alert system is the best method for CPSTL and I hope to do it in future. Also Event calendar will help to schedule IT equipment service maintenance dates and system administrator can monitor it. Therefor it will implement in future. Also like to enhance the system to get user feedback of service given by IT team. It will helps to improve their service by identifying problems.

Appendix A User Manual

How to Open “IT Equipment Maintenance & Tracking System”

- Open any web browser application you have. (eg. internet explorer, Firefox or Google chrome)
- Then type “10.10.13.100/pcrepair “ in address bar and press enter.
- After that you get login page of “IT Equipment Maintenance & Tracking System”.
- Now enter your Username and Password. Then click on Login button. After successful

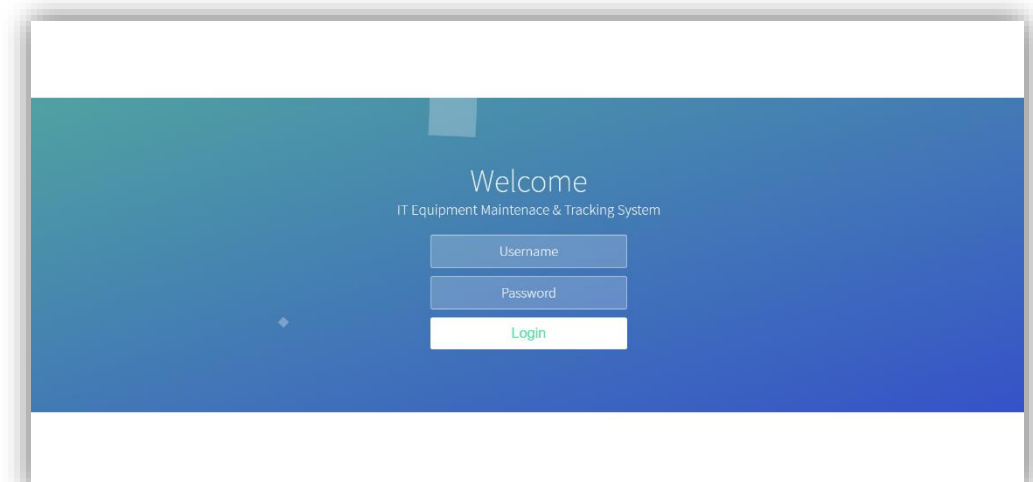

Figure A-1 Login Page

login you will get welcome page.

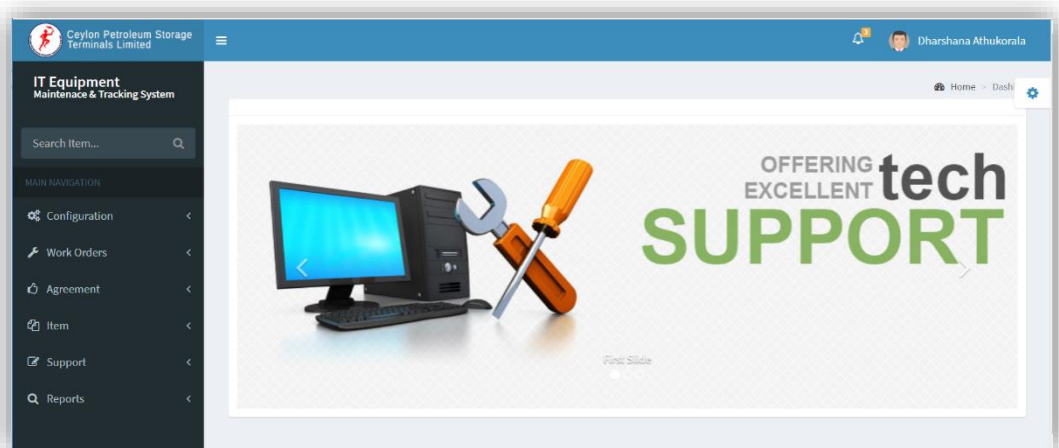

Figure A-2 Welcome Page

How to add Item

- First click on “Item” in menu bar and then click on “Item Creation” in sub menu. Then you will get following screen.

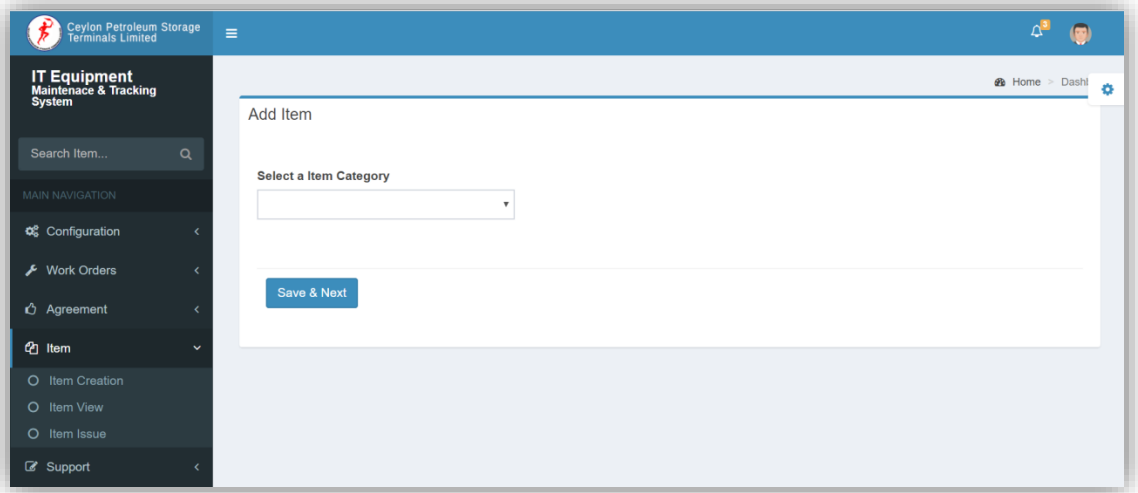

Figure A-3 Item Creation page

- Now select item category of the item you going to add from drop down list.

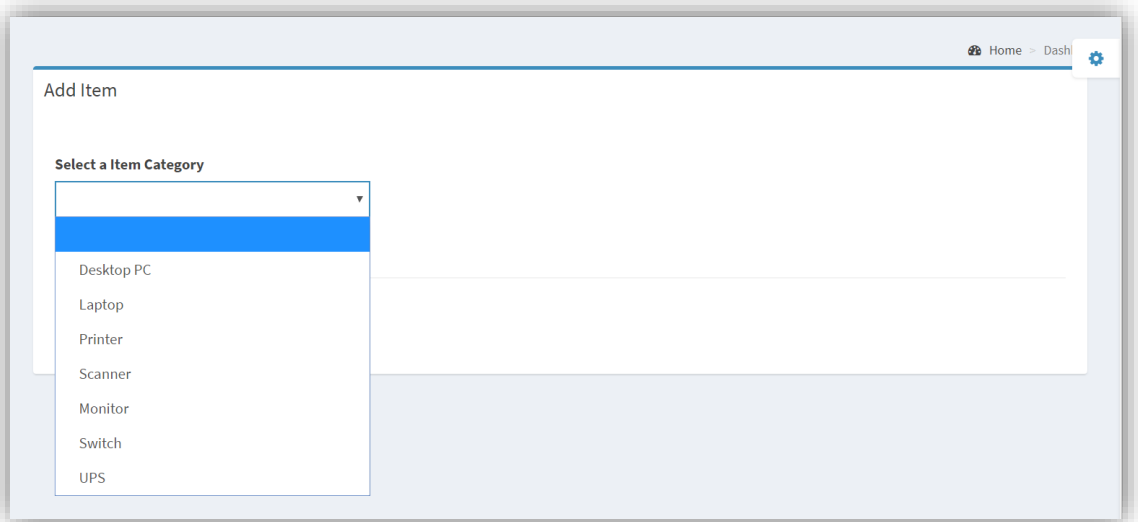

Figure A-4 selecting item category

- After selecting relevant item category, system ask some basic item details as follows.

Figure A-5 Basic Item details

- Then fill the relevant details and press “Save & Next” button.
- In next screen system request item parts details which you selected in previous screen.

Figure A-6 Requesting parts details

- To add parts details click on part name. Then part details form will load as follows.

Item Parts Details

Click on Parts name to fill the details

How to make a Complain

- Click on “Support” menu and next click on “Raise Complain”. Then you will get following screen.

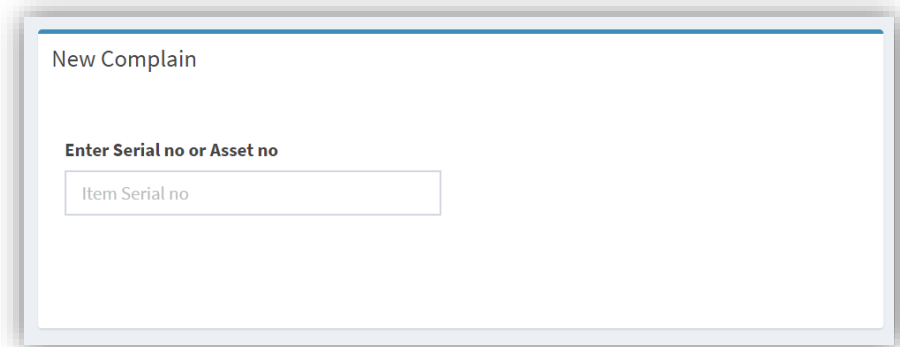

Figure A-10 Raise Complain

- Now enter Serial number or Asset number and press enter key. Then value you entered is correct, screen will be changed as follows. Right hand side window display some basic details of the item. It will help complainer to identify value he entered is correct.

Figure A-11 Complain Form

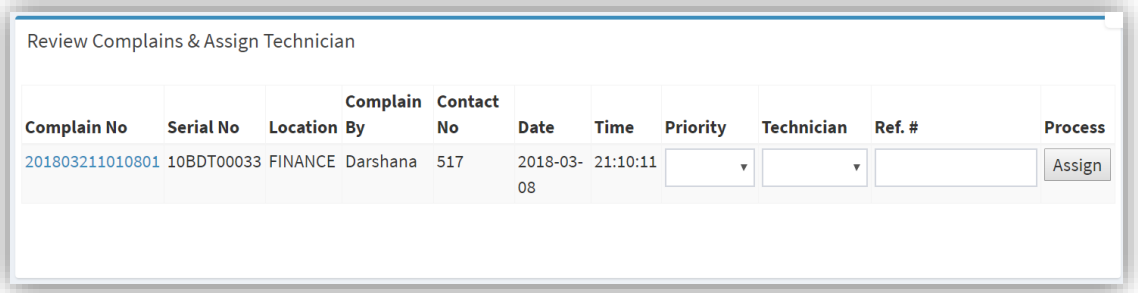

- Now fill the requested details and press “Raise Complain” button. After that you will get following confirmation message.

Figure A-12 Complain Status

How to view pending complains & assign technician

(How to Create Work Order)

- Click on “Work Orders” menu & then click on “Pending Complains” sub menu. Now you will get following page.

Complain No	Serial No	Location	By	Complain No	Contact No	Date	Time	Priority	Technician	Ref. #	Process
201803211010801	10BDT00033	FINANCE	Darshana	517	2018-03-08	21:10:11					Assign

Figure A-13 Pending complain report

- Now set the priority level and assign technician. Then you have reference number, add it and press “Assign” button.
- Then you will get following confirmation message, if it is successfully saved.

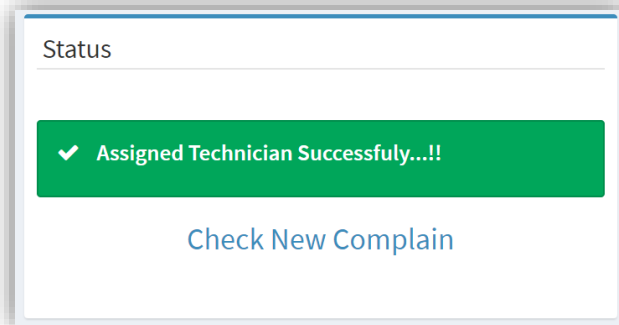

Figure A-14 Status of Assigned technician

How to maintain a work order

- Click on “Work Orders” in side menu bar and then click on “Pending Work Orders”.
- After that you will get following report of pending work orders.

Work Order No	Serial No	Asset No	Reference	Location	Complain By	Contact No	Date	Time	Priority	Technician

System Configuration

How to Create Item Category

- Click on “Configuration” in left side menu and then click on “Item Configuration” and then click on “Item Category”. Now you will get following screen.

The screenshot shows the 'Add Item Category' form in the IT Equipment Maintenance & Tracking System. The form is titled 'Add Item Category' and contains the following elements:

- A search bar labeled 'Search Item...' with a magnifying glass icon.
- A 'MAIN NAVIGATION' menu with the following items:
 - Configuration (expanded)
 - Item Configuration (expanded)
 - Item Category (selected)
 - Item Characteristics
 - Parts Configuration
 - User Configuration
 - Other Configuration
 - Work Orders
- A checkbox labeled 'Has Operating System'.
- A text input field labeled 'Item Category'.
- A blue button labeled 'Save Item Category'.

Figure A-32 Create Item Category

- If item has operating system, tick “Has Operating System” checkbox.
- Now give a name for item category and press “Save Item Category” button.

How to Create Item Characteristics

- Click on “Configuration” in left side menu and then click on “Item Configuration” and then click on “Item Characteristics”. Now you will get following screen.

Add Characteristics of Item

All Fields Are Required

Select a Item Category

Item Characteristic

Add

Figure A-33 Add Item Characteristics

- Now select relevant item category and enter characteristics or special feature of item you want to save.
- Then press “Add” button.

How to create part category

- Click on “Configuration” in left side menu and then click on “Parts Configuration” and then click on “Parts Category”. Now you will get following screen.

Add Parts Category

All Fields Are Required

Parts Category Description

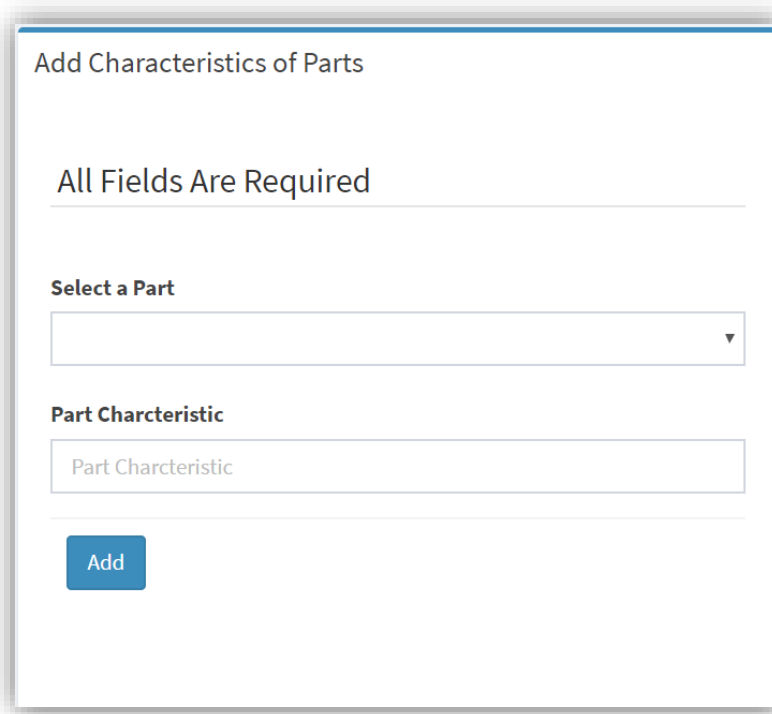

Create Parts Category

Figure A-34 Create Parts Category

- Now enter name for parts category and press “Create Parts Category” button.

How to create parts characteristics

- Click on “Configuration” in left side menu and then click on “Parts Configuration” and then click on “Parts Characteristics”. Now you will get following screen.

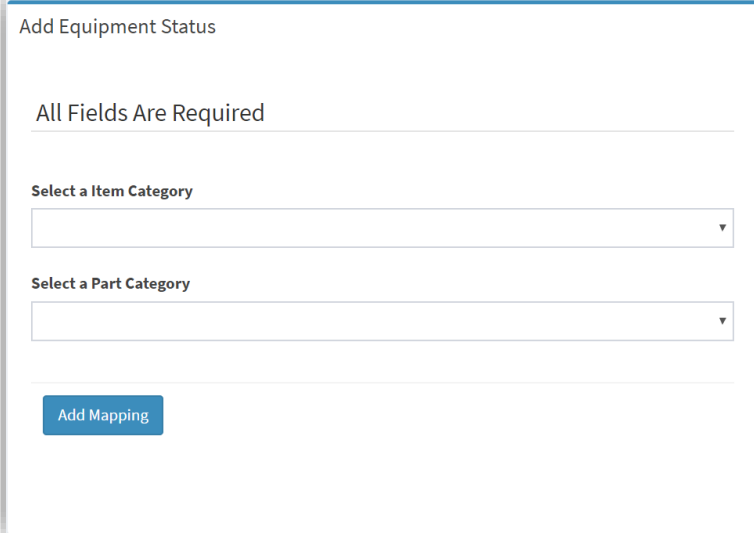

The screenshot shows a web form titled "Add Characteristics of Parts". At the top, there is a message "All Fields Are Required". Below this, there is a dropdown menu labeled "Select a Part". Underneath the dropdown is a text input field labeled "Part Characteristic". At the bottom of the form is a blue button labeled "Add".

Figure A-35 Add Parts Characteristics

- Now select relevant parts category and enter characteristics or special feature of part you want to save.
- For example RAM has size and type, bus speed characteristics
- Then press “Add” button.

Mapping item and parts

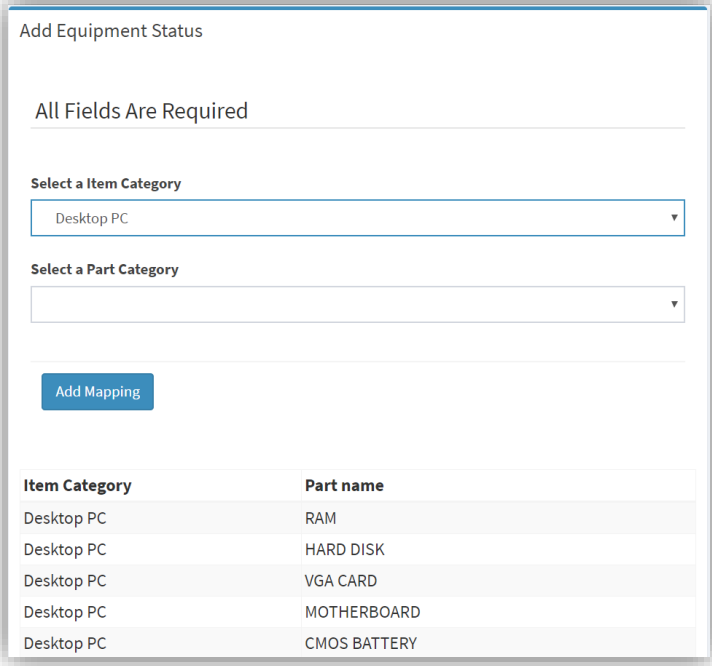

- Click on “Map Item & Parts” link in “Configuration” menu => “Parts Configuration” sub menu.
- Then you will get following screen.

The screenshot shows a web form titled "Add Equipment Status". At the top, it says "All Fields Are Required". Below this, there are two dropdown menus: "Select a Item Category" and "Select a Part Category". Both dropdown menus are currently empty. At the bottom of the form, there is a blue button labeled "Add Mapping".

Figure A-36 Map item & Parts form

- Now select item category and parts category to mapped. Then press “Add Mapping” button. All mapped parts are display in tabular format as follows.

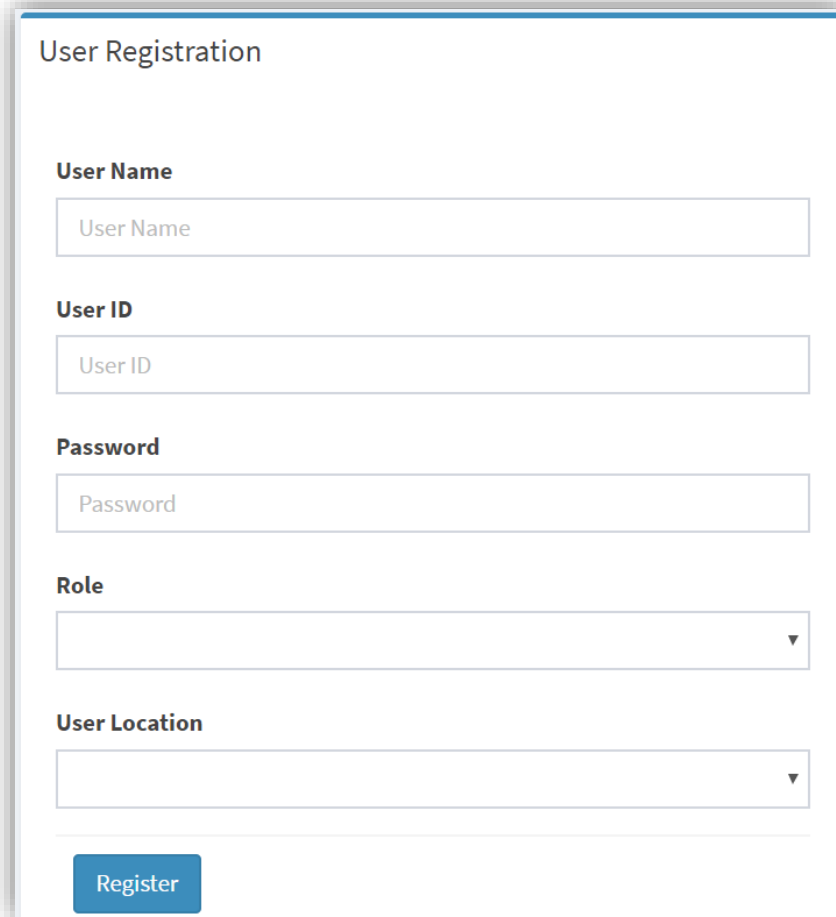

The screenshot shows the same "Add Equipment Status" form, but now the "Select a Item Category" dropdown menu is populated with "Desktop PC". The "Add Mapping" button is highlighted in blue. Below the form, a table displays the mapped parts.

Item Category	Part name
Desktop PC	RAM
Desktop PC	HARD DISK
Desktop PC	VGA CARD
Desktop PC	MOTHERBOARD
Desktop PC	CMOS BATTERY

Figure A-37 Details of mapped parts

How to create user logins

- Go to “Configuration” => “User Configuration” => “User Creation”
- Then you get following screen.

The image shows a web form titled "User Registration". It contains five input fields: "User Name", "User ID", "Password", "Role", and "User Location". Each field has a placeholder text of the same name. The "Role" and "User Location" fields are dropdown menus. At the bottom of the form is a blue "Register" button.

Figure A-38 User Creation form

- Now give “User Name”, “User ID”, “Password” and select “Role” and “User Location” from drop down list.
- After that press “Register” button.

Appendix B Test cases

Test Case ID	Functionality	Procedure	Expected Output	Priority	Result
User Registration					
01.	Create User	click on Configuration -> User Configuration -> User Creation then enter user name, user id, role, location & password. Next click on Register button.	"Successfully Register" message will appear	Medium	Ok
02.	Create User Without User ID	Fill other details except user id and click on register button	Error message will display	High	Ok
03.	Create User Without Password	Fill other details except password and click on register button	Error message will display	High	Ok

Table B-1 User Registration Test Case

Test Case ID	Functionality	Procedure	Expected Output	Priority	Result
User Login					
04.	Try to Access pages without login	go to url http://localhost/pcrepair/viewItem.php	Login Page appear	High	Ok
05.	Log with valid user id & password	enter valid user id & password	Display welcome page & your user name will appear in right top corner	High	Ok
06.	Log with valid user id & invalid password	enter valid user id & invalid password	Login page appear again	High	Ok
07.	Log with invalid user id & valid password	enter invalid user id & valid password	Login page appear again	High	Ok
08.	Log without user id & password	click login without user id & password	Login page appear again	High	Ok

Table B-2 User Login Test Case

Test Case ID	Functionality	Procedure	Expected Output	Priority	Result
Item Configuration					
09.	Add Item Category	click on Configuration -> Item Configuration -> Item Category Then enter category name & if item needs operating system to run, tick "Has operating system". Then click on "Save Item Category" button.	Successfully Saved message will appear	High	Ok
10.	Add Item Characteristics	click on Configuration -> Item Configuration -> Item Characteristics Then select Item Category and enter characteristics type. Then click on "Add" button	After selecting Item category, all existing characteristics type of selected item will be display below. After click add "Successfully Saved" message will appear	High	Ok
11.	Add Part Category	click on Configuration -> Parts Configuration -> Parts Category Then enter parts category description & click on "Create Part Category" button.	Successfully Saved message will appear	High	Ok
12.	Add Parts Characteristics	click on Configuration -> Parts Configuration -> Parts Characteristics Then select Part Category and enter Part characteristics type. Then click on "Add" button	After selecting Parts category, all existing characteristics type of selected part will be display below. After click add "Successfully Saved" message will appear	High	Ok

13.	Map Item & its' Parts	click on Configuration -> Parts Configuration -> Map Item & Parts After selecting Item Category and Part Category click on "Add Mapping" button.	After selecting Item category, all existing mapped parts category will be display below. After click "add Mapping" button "Successfully Saved" message will appear	High	Ok
14.	Mapping same item & parts again	select already mapped item category & part category. After that click on "Add Mapping" button.	Error message will display	High	Ok
15.	Adding Brand Names	click on Configuration -> Other Configuration -> Item / Parts Manufacture Enter Manufacture name & click on "Save Manufacture" button.	Successfully Saved message will appear	Medium	Ok
16.	Adding Location	click on Configuration -> Other Configuration -> Location Details Enter Location ID & description & click on "Save Location" button.	Successfully Saved message will appear	Medium	Ok
17.	Adding new location for existing location id	Enter existing location id & new location description. After that click on "Save Location" button.	Error message will display	High	Ok
18.	Add Software Details	click on Configuration -> Other Configuration -> Software Details Select software category and enter software name, version details and license validity time period. After that click on "Save Software Details" button.	Successfully Saved message will appear	Medium	Ok

Table B-3 Item Configuration Test Case

Test Case ID	Functionality	Procedure	Expected Output	Priority	Result
Item Creation					
19.	Create Item	Click on Item -> Item Creation	Appear new page with item category drop down	Medium	Ok
20.	Create Item	Select Item Category	Display input box for Item Serial no, Product no, Asset no, Manufacture, purchase date, warranty period, Item status & location. Also display check box with parts name which you mapped earlier.	High	Ok
21.	Create Item	Enter relevant details and tick parts attached to the item. After that click "Save & Next" button.	next page display all the parts you tick earlier. When you click on part name it will scroll down and asking basic details of part and its' characteristics.	High	Ok
22.	Create Item	Enter parts details and click on "Save & Next" button.	New screen will appear and asking to enter item characteristics and operating system details if it has.	High	Ok
23.	Create Item	Enter Item characteristics details and operating system details and click "Finish" button.	Successfully Saved message will appear	High	Ok
24.	Create item with existing serial number	Select Item Category and enter existing serial number and other details. After that click on "Save & Next" button	Error message will appear	High	Ok

Table B-4 Item Creation Test Case
